

Width-3 dependence: from row design to an SxPID error bound

Letters and patterns encode classes; color is supplementary. Same-class blocks are disjoint.

A. Width-three innovation blocks

$Z(t) = f(E(t), E(t+1), E(t+2))$, with independent $E_1, \dots, E_8$

Same letter -> disjoint blocks -> mutual independence within that class.
Different letters may overlap and may be dependent.

B. The auditable proof chain

Each arrow has a distinct obligation.
