

Fix the complete source marginal; redistribute only target mass

Lifting a source event gives a target cylinder. Its probability uses source-column totals, not allocation within a column.

What remains fixed and what can change

For this full-source cumulative witness, the averaged informative component stays at $\ln 2$ nats.
Its averaged misinformative component changes from $\ln 2$ to 0 nats; signed net changes from 0 to $\ln 2$ nats.
Do not transfer the informative-component theorem to the other components.
